

NEEDLE VALVE (Angle Pattern)

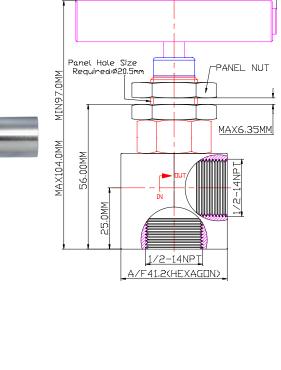

Descriptions

The needle valve is used to make relatively fine adjustments in the amount of fluid flow. They are often used as component parts of other valves, to shut off the flow of the process media to the pressure instrument.

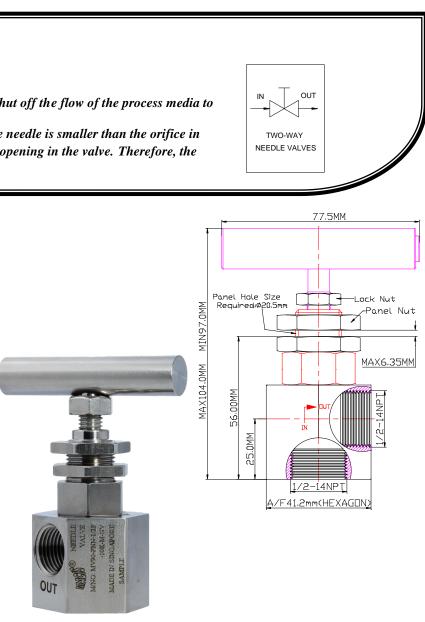

The characteristic of this valve is the long, tapered, needle like point on the end of the valve stem. This "needle" acts as a disk. The longer part of the needle is smaller than the orifice in the valve seat and passes through the orifice before the needle seats. This arrangement permits a very gradual increase or decrease in the size of the opening in the valve. Therefore, the valve can to provide fine flow adjustments. The number of handle turns can be directly correlated to the amount of flow

77.5MM
