FLOW CONTROL VALVE

Descriptions

Flow control valve combines a ball check and needle valve to provide effective speed control and fast close function. Flow adjustment can be made under pressure.

When turning the manual handle clockwise and with the working pressure entering the IN port, a tapered needle acts as a fixed orifice, the effective size of this orifice is increased as tapered needle is opened controlling flow to out port.

In the opposite direction, when reverse pressure flow exceeds the spring force, the spring biased ball inside the spring is unseated allowing free flow through it.
