Model: MV 9462-350L-180 (Pressure Range 100-350psi)

Descriptions

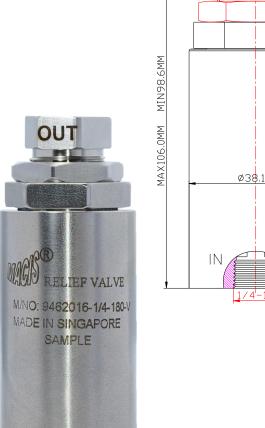

Relief valves (Pressure Safety Valves) are designed or set to open at a predetermined set pressure to protect other equipment from being subjected to pressures that exceed their design limits. The pressure media enters the relief valve, turning the spring housing clockwise will increase the relief valve pressure

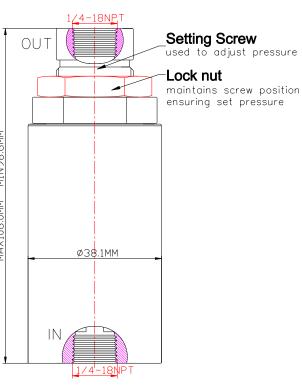

setting. Rotating the spring housing counterclockwise will decrease the relief valve pressure setting. When the set pressure is exceeded, the valve is forced open. They have excellent pressure relief and reset repeatability.

- —Leak tight when 90% of "set pressure" is applied.
- -Repeatability ±5% of "set pressure".

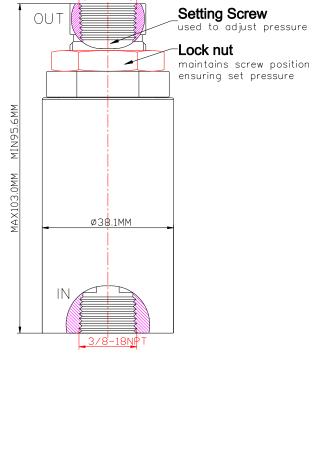

RELIEF VALVE

—Re-seating within 20-30% of "cracking pressure". State details when ordering.
